

HBase/PH^UENIX @ Scale

A study of Salesforce's use of HBase and Phoenix

Lars Hofhansl

Vice President and Principal Architect at [Salesforce](#)

Apache HBase, Apache Phoenix committer and PMC member

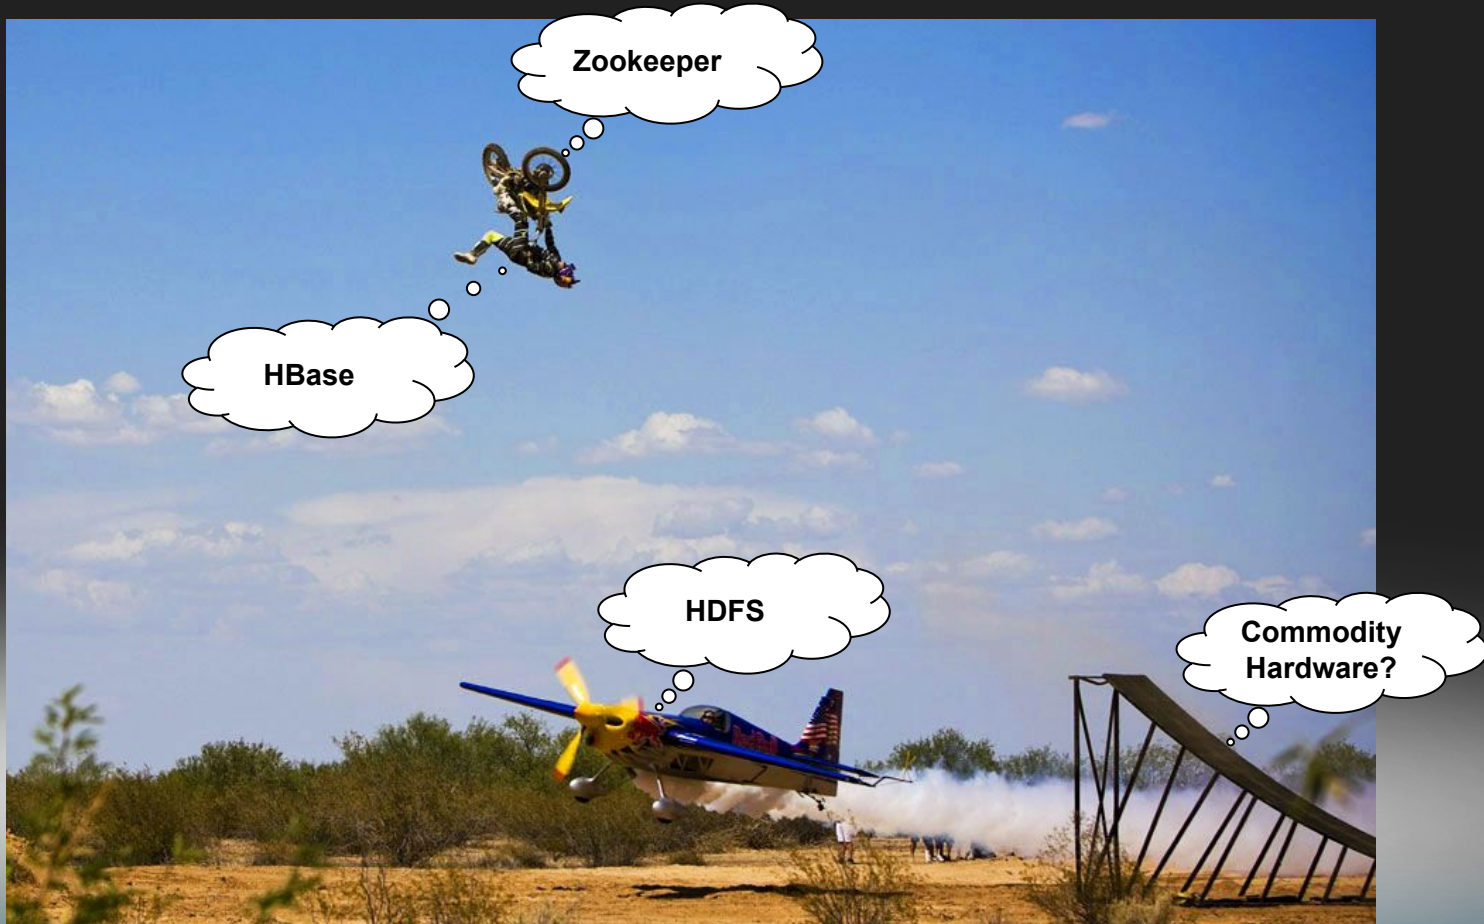

Two Years Ago, I showed you this

HBase/Phoenix are BIG* at Salesforce

* Numbers are from some time in the past and do not reflect the current scale

Heavy users of relational and semi-structure data

Mix of customer* and internal data

* Through the Salesforce Platform Offering

Typical Use Cases

- Samples of **Customer Data**:
 - **Login data** to track anomalies in **real-time**
 - **Archiving**, historical data moved from operational, relational storage to HBase
 - Denormalized **feed views** for Salesforce Chatter
 - Chatter @mention **low-latency relevancy** queries
 - **Storage** of user activity on marketing **campaigns** for reporting and **AI/ML**
- Samples of **Internal usage**:
 - Periodic **thread dumps** from all AppServers
 - **Machine metrics** from all machines

Customer Facing

> 100 clusters of varying size

~4bn write requests / day

~80TB written / day

That's about ~8 gbit/s, sustained

~600m read requests / day

~500GB read / day

Central Metrics Database

Central Metrics Database

OPENTSDDB

Collecting data from > 80.000 machines

11.4 trillion metrics stored and growing

2.8 tn metrics in 6 months and growing

210 bn reads in 6 months
